Q1. An online registration page looks attractive, but students struggle to find the submit button. The button is visually similar to less important links. Select the most appropriate improvement.

A. Add more decorative images
B. Strengthen the submit button's visual prominence
C. Increase the number of navigation links
D. Remove the field labels

Q2. A shopping website asks users to create an account before they can view products. Many visitors leave immediately. Select the change most likely to reduce this friction.

A. Allow visitors to browse before requiring registration
B. Add more mandatory registration fields
C. Display the registration form on every page
D. Hide the product categories

Q3. A mobile application uses different icons for the same "Save" action on different screens. Users hesitate before selecting them. Identify the design principle that needs improvement.

A. Personalisation
B. Animation
C. Consistency
D. Visual decoration

Q4. A student enters an invalid email address. The form displays "Error occurred" at the top of the page. Select the most helpful alternative.

A. Clear every field automatically
B. Reload the page without explanation
C. Display the same message in a larger font
D. Show "Enter a valid email address" beside the email field

Q5. A designer must learn why students abandon a course-registration process. Select the method that provides direct evidence of difficulties during the task.

A. Compare the colours of competing websites
B. Observe representative students completing registration
C. Ask developers to choose their favourite layout
D. Count the images on the registration page

Q6. An application indicates required fields using red colour alone. Some users cannot distinguish the indicator. Select the best improvement.

A. Add a visible "Required" label and appropriate programmatic information
B. Use a lighter shade of red
C. Remove all required-field indicators
D. Increase the page's background brightness

Q7. Users frequently delete records accidentally because “Delete” and “View” are close together and look identical. Select the best design response.

A. Make both buttons smaller
B. Remove the “View” button
C. Distinguish and separate the actions, and provide an undo option
D. Execute deletion when the user hovers over the button

Q8. A team wants to evaluate the arrangement of navigation, content, and form controls before selecting colours and images. Select the suitable design artefact.

A. Final logo
B. Brand colour palette
C. Finished promotional video
D. Low-fidelity wireframe

Q9. A payment takes several seconds to process. Users repeatedly click “Pay” because the interface appears unchanged. Select the appropriate improvement.

A. Hide the payment amount
B. Show processing feedback and prevent repeated submissions
C. Return the user to the homepage immediately
D. Add unrelated promotional content

Q10. A website’s navigation labels are “Explore,” “Discover,” and “More,” but users cannot predict where to find fee information. Select the most appropriate revision.

A. Use clear, task-specific labels such as “Fees” and “Admissions”
B. Replace all labels with unfamiliar icons
C. Hide the navigation until users scroll
D. Add more equally vague labels

Q11. A team compares two checkout designs. Design A has more completed purchases, but the designs were tested during different sales campaigns. Select the strongest conclusion.

A. Design A is definitely easier to use
B. Design B should be removed immediately
C. The campaign difference may explain the result; a controlled comparison is needed
D. Checkout design cannot affect purchase completion

Q12. A news application lets users change the text size without losing content or functionality. Identify the main benefit.

A. It guarantees faster internet access
B. It removes the need for navigation
C. It ensures all users prefer the same layout
D. It supports readability and accessibility for different users

Q1. A college is designing a student portal. Before deciding its features, the team needs to understand students’ difficulties with the existing system. Select the best first step.

A. Choose colours and fonts
B. Interview students about their needs and tasks
C. Copy another college's homepage
D. Add as many features as possible

Q2. Research shows that students usually open the portal to check attendance and upcoming deadlines. Select the most appropriate homepage design.

A. Place attendance and deadlines prominently
B. Display only the college's history
C. Put frequently used features inside several menus
D. Give every feature equal visual prominence

Q3. A team creates a user persona for a course-registration application. Select the most useful information to include.

A. The designer's favourite colours
B. A list of every available technology
C. Users' goals, behaviours, and difficulties found through research
D. Assumptions about users without supporting evidence

Q4. Students can view available courses but cannot find how to enrol. Select the best usability-testing task.

A. "Do you like this website?"
B. "Click the green button at the bottom."
C. "Explain the meaning of enrolment."
D. "Find a suitable course and complete enrolment."

Q5. A designer creates a low-fidelity wireframe before building a detailed interface. Identify the main purpose.

A. Test layout and navigation while changes are inexpensive
B. Finalise all images and animations
C. Measure the server's processing speed
D. Replace the need for user research

Q6. During testing, four out of five users misunderstand an icon. The designer believes its meaning is obvious. Select the appropriate response.

A. Keep it because the designer understands it
B. Revise the icon or add a clear label, then test again
C. Remove those users' results
D. Add instructions asking users to memorise it

Q7. An application is intended for older adults with varying digital experience. Select the strongest design approach.

A. Use small text to fit more information
B. Depend entirely on unfamiliar gestures

C. Use readable text, clear labels, and easy-to-select controls
D. Hide essential actions to simplify the screen

Q8. A team maps the stages of booking an appointment, including users' actions, emotions, and difficulties. Identify the artefact being created.

A. Colour palette
B. Database schema
C. Style sheet
D. User journey map

Q9. A revised form looks more attractive, but users take longer to complete it and make more errors. Select the best conclusion.

A. The design needs revision based on task-performance evidence
B. Appearance proves the redesign is successful
C. Completion time is irrelevant to usability
D. More errors indicate greater user engagement

Q10. After launching a service, the team collects user feedback and improves the interface repeatedly. Identify the approach demonstrated.

A. Designing once and avoiding changes
B. Iterative user-centred design
C. Choosing features only through developer preference
D. Replacing testing with visual decoration

Answer key: 1–B, 2–A, 3–C, 4–D, 5–A, 6–B, 7–C, 8–D, 9–A, 10–B.

on minlmilist, flat, navigation design questions

Minimalist, Flat, and Navigation Design: Practice MCQs
Select the best answer. Each question carries 1 mark.

Q1. A college homepage contains several banners, decorative images, and repeated announcements. Students struggle to locate admission information. Select the best application of minimalist design.

A. Remove all text and display icons only
B. Retain essential content and remove unnecessary visual elements
C. Give every announcement a different colour
D. Replace navigation labels with animations

Q2. A designer removes labels from a registration form to make it look cleaner. Users now struggle to understand the fields. Select the most appropriate correction.

A. Restore clear labels while keeping the layout simple
B. Reduce the input fields' size
C. Use identical placeholders in every field
D. Hide the form until users click an image

Q3. A weather app uses simple shapes, solid colours, and icons without realistic textures or three-dimensional effects. Identify the visual style.

A. Skeuomorphic design
B. Photorealistic design
C. Flat design
D. Textured design

Q4. In a flat interface, users cannot distinguish clickable buttons from ordinary text. Select the best improvement.

A. Make all text look like buttons
B. Remove the buttons' labels
C. Use colour alone to identify every action
D. Give buttons clear shapes, contrast, and interaction states

Q5. A university website has navigation labels such as "Discover," "Explore," and "More." Users cannot predict where fee details are located. Select the best revision.

A. Use descriptive labels such as "Admissions," "Fees," and "Courses"
B. Add more vague labels
C. Replace every label with an unfamiliar icon
D. Arrange links randomly on each page

Q6. A shopping website displays the following above a product:

```
Home → Electronics → Laptops → Gaming Laptops
```

Identify the navigation pattern.

A. Pagination
B. Breadcrumb navigation
C. Hamburger menu
D. Tab navigation

Q7. A mobile app has four destinations that users switch between frequently. Select the most suitable approach.

A. Hide all destinations inside nested menus
B. Require users to return to the homepage each time
C. Use a labelled bottom navigation bar
D. Display navigation only after a long press

Q8. A website highlights "Courses" while the user is browsing its course section. Identify the main benefit.

A. It reduces the number of webpages
B. It automatically improves internet speed
C. It prevents users from visiting other sections
D. It helps users recognise their current location

Q9. A designer adds generous spacing between related content groups. Identify the main purpose of this whitespace.

A. Improve readability and clarify visual grouping
B. Increase the amount of information on screen
C. Remove the need for headings
D. Make every element equally prominent

Q10. A website's dropdown menu opens only when a mouse pointer hovers over it. Keyboard users cannot access its links. Select the best correction.

A. Add more hover animations
B. Support keyboard operation and visible focus indicators
C. Remove the text from the menu
D. Increase the menu's background opacity

Q11. A designer wants to make a "Register" action prominent while preserving a minimalist interface. Select the best approach.

A. Add several competing primary buttons
B. Hide the action in the footer
C. Use one clearly labelled primary button with sufficient contrast
D. Replace the button with a decorative image

Q12. A team wants to check whether users can find "Scholarship Eligibility" within a proposed menu structure before designing the final pages. Select the most suitable method.

A. Colour-preference survey
B. Animation review
C. Image-quality inspection
D. Tree testing of the navigation hierarchy

Q1. A college homepage contains several banners, decorative images, and repeated announcements. Students struggle to locate admission information. Select the best application of minimalist design.

A. Remove all text and display icons only
B. Retain essential content and remove unnecessary visual elements
C. Give every announcement a different colour
D. Replace navigation labels with animations

Q2. A designer removes labels from a registration form to make it look cleaner. Users now struggle to understand the fields. Select the most appropriate correction.

A. Restore clear labels while keeping the layout simple
B. Reduce the input fields' size
C. Use identical placeholders in every field
D. Hide the form until users click an image

Q3. A weather app uses simple shapes, solid colours, and icons without realistic textures or three-dimensional effects. Identify the visual style.

A. Skeuomorphic design
B. Photorealistic design
C. Flat design
D. Textured design

Q4. In a flat interface, users cannot distinguish clickable buttons from ordinary text. Select the best improvement.

A. Make all text look like buttons
B. Remove the buttons' labels
C. Use colour alone to identify every action
D. Give buttons clear shapes, contrast, and interaction states
