

HTML Forms: Practice Questions

1. Student registration form

Create a form that collects a student's full name, university email, password, and phone number. Make all fields required. The password must contain at least eight characters. Submit the form to `register.php` using `POST`.

2. Appointment booking form

Create a form where a student selects a meeting date and a time between 9:00 AM and 5:00 PM. Add a text area for the reason for the meeting and a submit button.

3. Workshop preference form

A college offers workshops on Web Development, Python, and AI. Create a form that lets a student select **one** workshop and **multiple** preferred activities. Use the appropriate input types for each choice.

4. Feedback form

Create a form that asks for a participant's name, email, satisfaction rating from 1 to 10 using a slider, and written feedback. Display a label for every input.

5. File submission form

Students must submit a PDF assignment. Create a form with a roll number field and a file input that accepts PDF files. Set the form attributes needed to upload the file to `upload.php` using `POST`.

6. Find the errors

The following form is intended to collect an email address and submit it to `signup.php`. Identify and correct **three errors**.

```
<form action="signup.php" method="GET">
  <label for="email">Email:</label>
  <input type="text" id="studentEmail" required>
  <button type="button">Sign up</button>
</form>
```

7. Predict the result

A user enters Asha and selects Web Development in this form. Write the URL requested when the user submits it.

```
<form action="search.php" method="get">
  <input type="text" name="student" value="Asha">

  <select name="course">
    <option value="web" selected>Web Development</option>
    <option value="python">Python</option>
  </select>

  <button type="submit">Search</button>
</form>
```

8. Form validation scenario

A registration form should accept an age from 18 to 25 and prevent submission when the age field is empty. Write the required `<input>` element.

9. Form target scenario

A form appears inside an `iframe`. After submission, its result should replace the page containing the `iframe`. Write the `target` attribute needed on the `<form>` element and explain its effect in one sentence.

10. Complete webpage task

Build an HTML page containing a course enrolment form with name, email, phone, course selection, preferred class time, agreement checkbox, and submit/reset buttons. Use suitable input types, labels, and required fields.

Advanced HTML Forms: Practice Questions

1. Multi-step admission form

Design a single-page admission form with three clearly grouped sections: personal details, academic details, and course preferences. Collect the student's name, date of birth, email, phone number, Class 12 percentage (0–100), preferred course, and up to three extracurricular interests. Include a document upload that accepts PDF files only. Use `<fieldset>` and `<legend>`, appropriate input types, labels, and validation attributes. Submit to `admission.php` using `POST`.

2. Conference registration with dependent rules

Create a conference form with two attendee types: *Student* and *Faculty*. Collect name, institutional email, attendance mode (online or in person), and a workshop choice. An in-person attendee must also provide a meal preference. Add HTML and JavaScript so the meal field becomes visible and required only when “In person” is selected. Explain why HTML attributes alone are insufficient for this condition.

3. Appointment form with time slots

A clinic accepts appointments Monday to Friday, from 9:00 AM to 5:00 PM, in 30-minute slots. Create a form collecting patient name, phone number, appointment date, preferred time, and reason for visit. Use built-in HTML constraints wherever possible. Add JavaScript to reject weekends and dates in the past.

4. Product order form with calculated total

Build an order form for a notebook priced at ₹120 and a pen priced at ₹20. Let the customer enter a quantity from 0 to 10 for each item. Display the total in an `<output>` element whenever a quantity changes. Collect a delivery address and require an agreement checkbox before submission. Use JavaScript to prevent an order when both quantities are zero.

5. Account creation with conditional validation

Create an account form with username, email, password, confirm password, and a checkbox labelled “Show passwords.” Require a password of at least eight characters. Use JavaScript to check that the two passwords match, show a useful error message, and prevent submission when they differ. Keep the HTML labels and error message accessible.

6. Debug and improve the upload form

The following form should upload a student's PDF project and email address. Identify **at least six problems**, then rewrite it.

```
<form action="upload.php" method="get">
  <label for="email">Email</label>
  <input type="text" id="studentEmail">

  <label for="project">Project PDF</label>
  <input type="file" id="project" name="project" accept=".jpg">

  <button type="button">Upload</button>
</form>
```

7. Form submission and URL analysis

Study the form below. The user enters Asha Verma, selects “AI,” leaves “Updates” unchecked, and clicks **Find**. Write the resulting request URL and explain why one field is absent.

```
<form action="courses.php" method="get">
  <input name="student" value="Asha Verma">

  <select name="topic">
    <option value="web">Web Development</option>
    <option value="ai" selected>AI</option>
  </select>

  <input type="checkbox" name="updates" value="yes">
  <button type="submit">Find</button>
</form>
```

8. Complete lab challenge: Event registration

Build a responsive event registration page with a form that collects participant details, one event category, multiple skills, an arrival date and time, and an optional PDF permission letter. Include an accessible validation message for each field that fails a custom rule. On successful submission, show a summary of the entered details **without sending them to a server**. Treat any user-entered text as text when displaying the summary; do not insert it as HTML.
